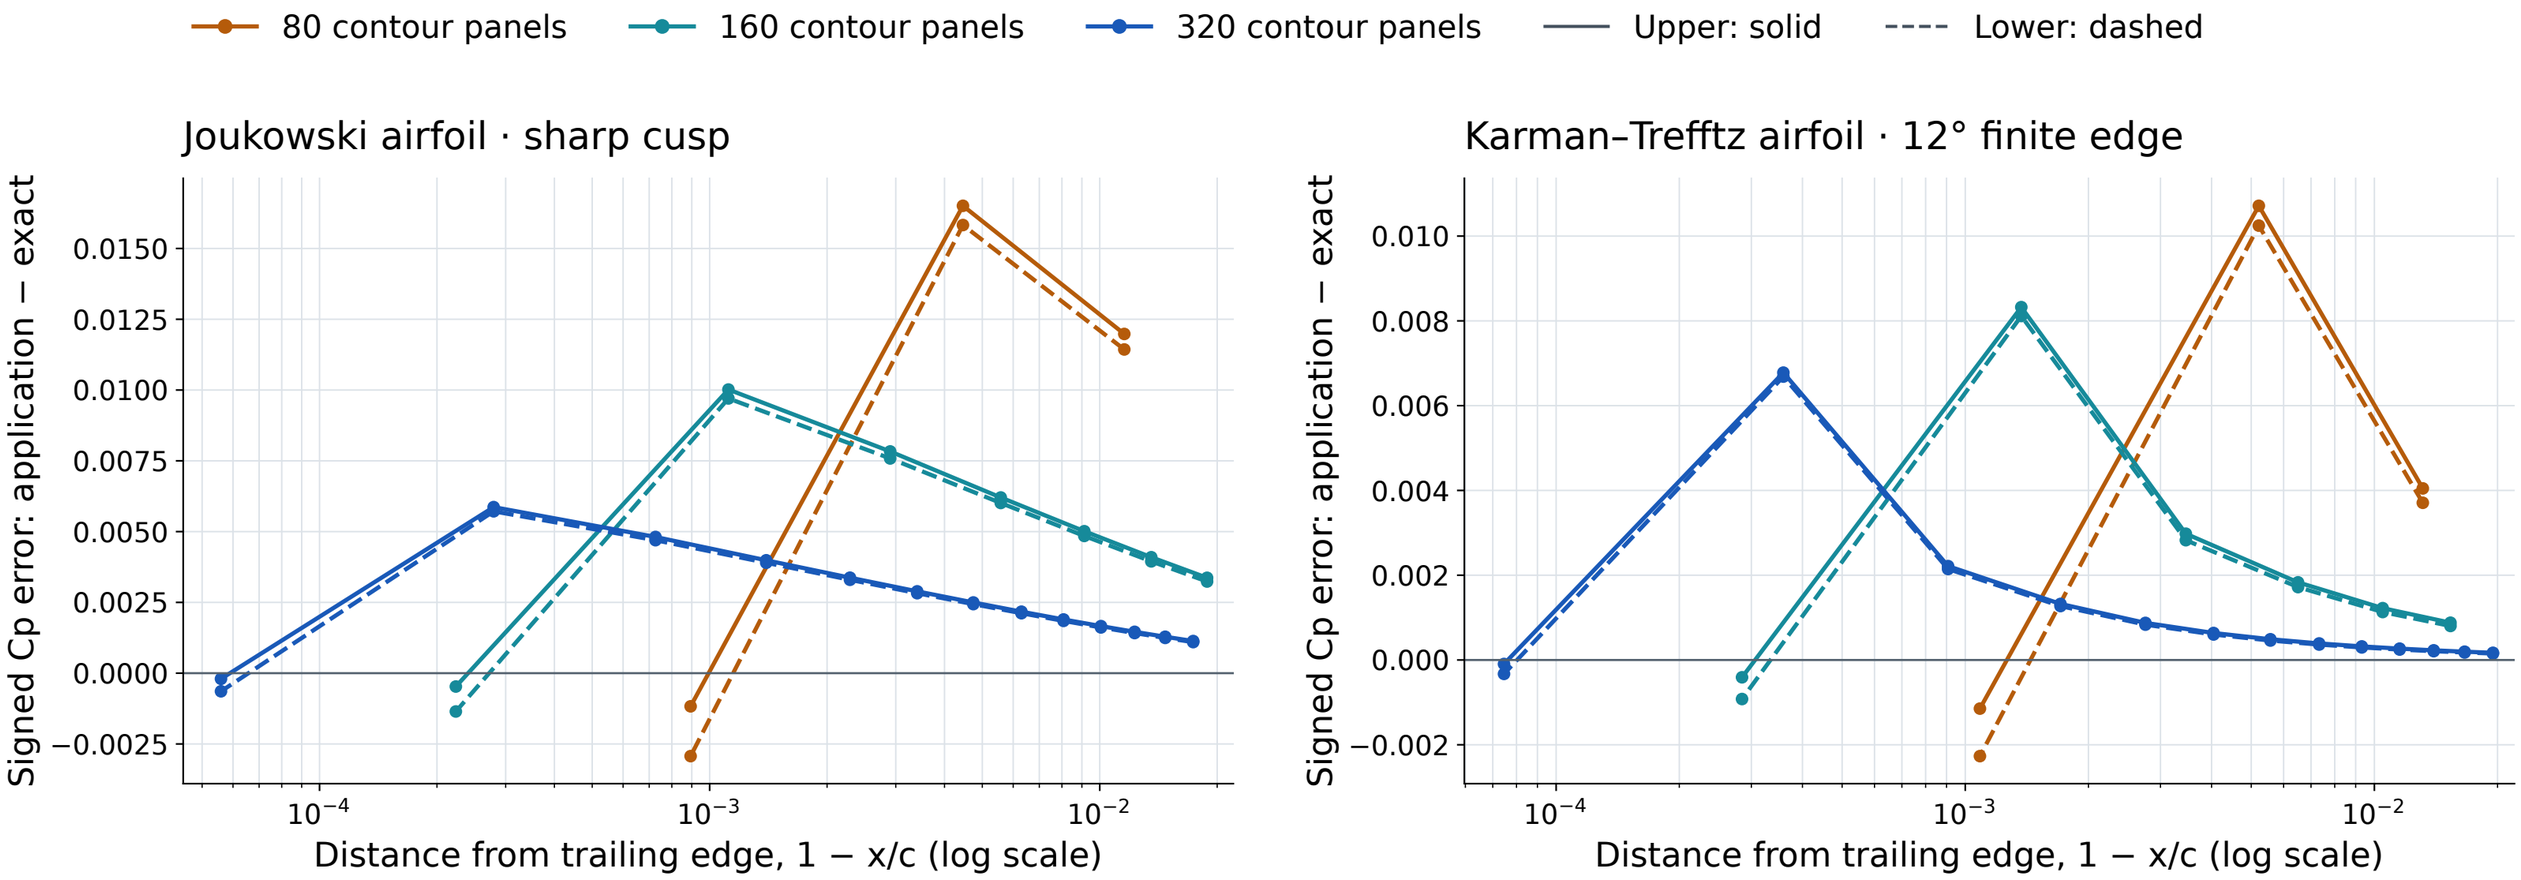
Trailing-edge discretization error · same-point comparison

Application Cp − exact Cp at each panel centre; α = 4°. All samples in the last 2% of chord are shown.



The exact edge is at zero distance and is not a panel-centre sample. Mesh refinement moves the sampling locations.
Finite-panel discrepancies are real error: Kutta equality at the mathematical edge does not remove this near-edge error.

Only the raw sample positions and errors are connected. These exact-flow checks do not establish viscous or experimental accuracy.
